

# SWITCH

## Media playback, inspection and conversion tool for professionals

**Everything you need in one application.** Switch allows you to play a variety of web and professional media formats, inspect and adjust the properties of the file and export a new file. All this in one professional application for Mac, backed by the trusted technology of Telestream.

### Play it

Use Switch for luminous high quality playback of all your videos. Switch has all the playback control features you'd expect in a professional player such as fast forward and rewind, slow motion, as well as single-frame forward and back. Multi-format playback support includes MOV, MP4, MXF, GXF, MPEG-2 Transport Streams and more.

### Check it

Open the inspection tool to see the properties of your media. Check audio channels, speaker labels, aspect ratio, aperture information, bitrate, frame rate, metadata, encoding formats and more. There's a fully featured audiometer panel where you can check your audio levels and even solo or mute audio channels. You can also load secondary audio or closed caption files, which can be included in an export.

### Switch it

Switch to export mode to make changes to the file: specify a new file format; a new video or audio codec; trim, scale or crop the video; add metadata and insert chapter markers. You can even rearrange audio tracks and edit speaker assignments. Video and Audio pass-through mode allows you to make non-encoding-related changes to your media.

Switch also contains a built-in verification and packaging preset that lets you export and create a complete iTunes store package
